CATALOG OF RECENT CETACEA IN THE MUSEO NACIONAL DE HISTORIA NATURAL (MNHN), URUGUAY

PRADERI, R.*; JURI, E.*; RIVERÓN, S.*; VALDIVIA, M.*; D'IMPERIO, J.*; SAAVEDRA, J.*; LOPEZ, F.*; SITYA, V.*; GONZALEZ, E. M.* & LE BAS, A.**

ABSTRACT – The Museo Nacional de Historia Natural (MNHN) currently houses 670 specimens of recent Cetacea. This collection is composed mostly by skulls of individuals collected in Uruguay, although there are also some exotic specimens. The Families represented are: Balaenidae (6 specimens), Balaenopteridae (14), Neobalaenidae (2), Delphinidae (67), Phocoenidae (15), Physeteridae (5), Iniidae (552) and Ziphiidae (9). For each specimen are reported: Locality, Date, Catalog number, Sex, Condylbasal length, Nature of the material, Condition and comments. The purpose of this catalog is to provide accurate information to the scientific community about the materials already stored in the MNHN.

Key words: Catalog, Cetacea, Collection, Museum, Uruguay.

Introducción

In spite of their modest extension, Uruguayan waters exhibit an important diversity of cetaceans. To date, 30 species were cited, making almost the 28% of the total number of mammals cited for Uruguay. Whereas most of them have widespread distributions, *Pontoporia blainvillei* and *Phocoena spinipinnis* are restricted to coastal waters of South America.

* Sección Mamíferos, Museo Nacional de Historia Natural (MNHN). ** Facultad de Ciencias, Universidad de la República. Montevideo, Uruguay. E-mail contact: lebas@fcien.edu.uy

Our knowledge on cetaceans comes mainly from their strandings along the 680 km of coastline (River Plate and Atlantic Ocean). Storms, by-catch, abrupt oceanographic changes and extralimital forays are the principal causes that lead a cetacean to strand in our coasts.

In Uruguay, the systematic work on cetaceans began in the 1960's. More recently, the increased effort in local cetacean research allowed systematic coastline examinations for carcasses as well as opportunistic concurrences starting from local people alert. As a result, the Uruguayan scientific collections have increased the number of cetacean specimens.

The Museo Nacional de Historia Natural (MNHN) currently holds 670 specimens of recent cetacea, represented by partial osteological material (mostly skulls), gonads or complete skeletons. The collection includes 22 mysticeti species (6 Balaenidae, 14 Balaenopteridae and 2 Neobalaenidae) and 648 odontoceti (67 Delphinidae, 15 Phocoenidae, 5 Physeteridae, 552 Iniidae and 9 Ziphiidae).

The MNHN was created in 1837. During its 174 years of existence, this institution maintained itself as a permanent nucleus of research and education. As a consequence, the cetacean collection contains specimens obtained in the nineteenth century, although the main bulk dates from 1970 to present.

The purpose of this catalog is to provide accurate information about this collection to the scientific community. Since cetaceans are not easily available, museum collections are essential tools when the sample size is a key factor. On the other hand, cetacean collections in the southern hemisphere are frequently overlooked. This is especially problematic if the topic in research involves geographical comparisons.

The authors encourage researchers to make use of the cetacean specimens already stored in the MNHN.

The current data of the MNHN are:

Material and Methods

The format of this catalog was brought from McLaren *et al.* (1986) Catalog of the Recent Marine Mammals in the Carnegie Museum of Natural History.

We follow the systematics of Mead & Brownell (2005) and present here specimens incorporated to the MNHN until December 31, 2008. As the systematics of Cetacea is actually a subject of intense revision, a continuous work of taxonomic actualization will be carried out as new issues become available.

The taxonomic identification of all specimens was made, confirmed or corrected by literature revision (FAO, 1977; Leatherwood *et al.*, 1982; Leatherwood & Foster, 1983; Lichter & Hooper, 1983; Cárdenas *et al.*, 1986; Baker, 1990; Jefferson *et al.*, 1993 and Reyes & Molina, 1997).

All specimens are arranged by species and catalog number. The acronym of the Museum is MNHN. No subspecific categories were assigned.

Explanation of headings

Locality

As most material corresponds to beached or stranded animals, the name of the locality was taken from the original tag as Country, Department, Locality. Geographical coordinates were added here, but they must be taken as approximations. The coastal midpoints of localities (mostly resorts) were obtained from maps and internet tools as the coordinates presented here. The material collected after 2006 has more accurate coordinates, obtained by GPS *in situ* or by the identification of the collection area using Google Earth™ free program (Google, 2008). Location of some specimens by-caught at sea are provided, but in the case of *Pontoporia blainvillei* by-caught in the artisanal fisheries of Punta del Diablo, Valizas and Cabo Polonio in the period 1973-1976, such information is not available and only the port coordinates are provided.

Date

This date corresponds to the day in which an animal was firstly identified at field. Therefore, the date of collection must not be taken as date of death for stranded specimens. This is not the case of the specimens of *Pontoporia blainvillei* obtained from Punta del Diablo, Valizas and Cabo Polonio in the period 1973-1976: the day of collection corresponds for these animals to the day of by-catch by artisanal fisheries.

Sex

Sex is represented by the symbols F, M, ? to denote female, male or undetermined, respectively. Sex determination was obtained by visual inspection of external or internal genitalia. In this catalog, no sex determination was inferred from craniometric measures.

Condylbasal length / Age category

Whenever possible, condilbasal length (CBL) is provided in mm. If some damage does not allow an accurate measurement, the approximate values are presented in brackets. When this measure is not possible because major damage, is denoted by the symbol (?). In such cases, additional data taken from specimen tag, skull shape,

sutures and teeth characteristics allowed to provide the categories of Foetus, Immature or Adult (Foetus, Imm or Ad, respectively).

Nature of specimen

This item denotes the type of preservation: SK = Skull (cranium + jaws); CO = Cranium Only; CS = Complete Skeleton; PS = Partial Skeleton; WS = Whole Specimen in fixative solution; OP = Only Parts of skull (e.g.: bullae, beak, braincase); DB = Dried Baleen plates.

Condition and comments

This item refers to the state of specimen conservation. “Good” means that the material is able to measurements or anatomical study (e.g.: skulls and tissue samples). Otherwise, it is noted as “broken” or “missing pieces”. If the nature of the stored material is WS, its condition (entire individual, organ, muscle sample, stomach content, etc.) is reported as a comment.

Acknowledgements

We thank all the members of the staff of the MNHN, specially Victor Scarabino, Javier Gonzalez and Fabrizio Scarabino for their permanent support. We are indebted to Alberto Ponce de León, Cesar Barreiro and Graciela Fabiano (Dirección Nacional de Recursos Acuáticos) for their technical assistance. We appreciate very much the continuous collaboration of Pablo Etchegaray (Museo del Mar de Punta del Este), Rodrigo García-Píngaro (Organización de Conservación de Cetáceos, OCC) and Ricardo Fierro, a fisherman who became an enthusiastic collaborator of the MNHN.

This contribution is a result of the legacy of Ricardo Praderi (1936-2010), researcher of the Museo Nacional de Historia Natural of Montevideo. Pioneer in the cetacean studies in Uruguay, with more than 50 years dedicated to the research, excellent professor and beloved friend.

Simplified taxonomic list (Mead & Brownell, 2005). Only the available species are included. Exotic taxa are marked with *.
